Summary

Backend engineer with 7+ years of experience building fault-tolerant data pipelines, event-driven services, and multi-tenant platforms. Comfortable owning systems end-to-end across design, scaling, production reliability, and incident reduction. Strong in Node.js, TypeScript, Kafka, MongoDB, PostgreSQL, Redis, and Kubernetes on GCP/AWS.

Experience

Software Engineer III — **Fynd (Reliance Retail)** | Sep 2022 – Present

Node.js · TypeScript · MongoDB · Redis · Kafka · RabbitMQ · Kubernetes · GCP

- Architected a **6-stage fault-tolerant ingestion pipeline** (Configure → Entity Selection → Staging → Map → Transform → Migrate) processing **200–500 records/sec** at p99 **200–400 ms**; per-stage checkpointing, dead-letter queues, and idempotent writes enable safe re-runs with zero duplication across **1M+ records** migrated to date. **(Fynd Star 2026)**
- Cut peak pod memory by ∼**80%** (**1.5 GB** → **300 MB**) on 200K+ record jobs by replacing bulk loads with **cursor-based streaming and adaptive chunk sizing** tuned to downstream write throughput; eliminated OOM-driven pod restarts.
- Designed the worker orchestration layer – **token-bucket concurrency, back-pressure propagation, and priority queuing** – enabling **5–10 concurrent merchant migrations** on a shared fleet without resource contention or noisy-neighbour effects.
- Tech-led **Fynd Migrate** (Shopify → Fynd) end-to-end across **3–5 engineers**; platform serves **50+ merchants** and replaced a **2–3 day** manual onboarding flow with self-serve, removing ∼70% of operational effort.
- Owned **Fynd Coupons** from 0 → **97K MAU**; designed APIs, Redis-backed caching, and rate limits. Sustained **200–500 req/s** at p99 **150–300 ms** with **99.9%** availability over **6–12 months** on-call. **(Fynd Star 2025)**
- Reduced production incidents by **40%** across owned services (rolling 90-day baseline) via per-dependency circuit breakers, liveness/readiness probes tied to real health signals (not process-up), and bounded error propagation between microservices. **(Fynd Star 2024)**
- Established design-doc and code-review standards for the team; mentored **3–6 engineers** on distributed-systems fundamentals (consistency, idempotency, retry semantics, failure modes). **(Fynd Star 2023)**

Senior Software Engineer — **Byju's** | Jul 2021 – Aug 2022

Node.js · PostgreSQL · Redis · Microservices

- Designed and owned **Teacher Tech** – internal platform for onboarding, scheduling, audit, and payroll across **10,000+ tutors**; cut payroll cycle from **3–4 days** → **1 day** and removed engineering bottleneck for 3 ops teams.
- Built **Tutor CMS** for course and batch management, taking routine academic-content updates from **dozens of eng-tickets/month** → **near-zero manual dependency**.

Software Engineer — **Acube Tech** | May 2020 – Jun 2021

Node.js · MongoDB

- Built backend for a **healthcare teleconsultation platform** supporting concurrent real-time patient↔expert sessions with high availability.

Product Engineer — **Codingmart** | Oct 2018 – May 2020

Node.js · RabbitMQ · MongoDB

- Built **event-driven microservices on RabbitMQ** for BookMyShow's ticketing stack, decoupling booking, inventory, and notification flows for fault isolation and throughput.

Skills

Languages: JavaScript (Node.js), TypeScript, SQL
Backend: Distributed systems, microservices, event-driven architecture, REST APIs, GraphQL, system design
Streaming & Messaging: Kafka, RabbitMQ
Data & Infra: MongoDB, PostgreSQL, Redis, Docker, Kubernetes, GCP, AWS, CI/CD
Focus Areas: Scalability, fault tolerance, performance optimization, on-call, incident response

Education

B.E. Computer Science – K.S. Rangasamy College of Technology — 2015 – 2019
