Summary

Backend and platform engineer with 7+ years leading product-to-platform execution across migration systems, partner-portal workflows, data pipelines, reliability, and LLM/AI-agent observability. Operates in a technical-lead capacity across architecture, execution planning, code review, mentoring, RCA, on-call, and release readiness. Core stack: Node.js, TypeScript, React, Kafka, MongoDB, PostgreSQL, Redis, Kubernetes, GCP/AWS.

Experience

Software Engineer III

Fynd (Reliance Retail) | Sep 2022 – Present

Node.js, TypeScript, React, Vue, MongoDB, Redis, Kafka, Kubernetes, GCP

- Led the **Partner Portal / UPP flow**, shaping the partner-growth journey from lead submission to deal tracking, project delivery, and eligible earnings; defined organization-readiness states across profile setup, partner agreement, Academy completion, public-profile visibility, resource surfaces, and Partner Portal hand-offs.
- Tech-led **Fynd Migrate** (Shopify to Fynd) across a small engineering team; architected a **6-stage fault-tolerant migration pipeline** with checkpointing, DLQs, and idempotent writes, processing **300 records/sec** at **p99 under 400 ms** and enabling safe re-runs across **1M+ records** for **50+ merchants**.
- Built a **migration validation workbench** using deterministic field-level checks as the trust anchor with an **optional LLM audit layer**; covered 6 entity types with batch validation, live Fynd API resolution, split comparison views, and **52 regression tests across 9 files**.
- Contributed to **AgentSentinel**, an internal LLM/AI-agent observability and cost-intelligence platform; defined trace/span modeling for agent runs, LLM/tool/DB spans, latency, token usage, cost, failures, and loop detection; validated release readiness across **138 frontend / 416 backend tests**.
- Established an **AI-assisted engineering operating model** using rules, path-scoped context, review/debug agents, syntax hooks, project memory, and deploy safeguards, making AI-generated code changes safer, reviewable, and repeatable.
- Cut peak pod memory **80% (1.5 GB to 300 MB)** on 200K-row bulk jobs by replacing bulk loads with **cursor-based streaming and adaptive chunk sizing**, eliminating OOM-driven pod restarts.
- Reduced production incidents **40%** (rolling 90-day baseline) across owned services via per-dependency circuit breakers, health-signal-based liveness/readiness probes, and bounded error propagation between microservices.
- Owned **Fynd Coupons** from 0 to **97K MAU**: designed APIs, Redis-backed caching, and rate limits; sustained **300 req/s** at **p99 under 300 ms** with **99.9% availability**.

Senior Software Engineer

Byju's | Jul 2021 – Aug 2022

Node.js, PostgreSQL, Redis, React, Microservices

- Designed and owned **Teacher Tech**, an internal onboarding, scheduling, audit, and payroll platform for **10,000+ tutors**; cut the payroll cycle from **3–4 days to 1 day** and removed the engineering bottleneck for 3 operations teams.
- Built **Tutor CMS** in React for course and batch management, moving routine academic-content updates from dozens of engineering tickets per month to near-zero manual dependency.

Software Engineer

Acube Tech | May 2020 – Jun 2021

Node.js, MongoDB

- Built the backend for a **healthcare teleconsultation platform** supporting concurrent real-time patient-to-expert sessions with high availability.

Product Engineer

Codingmart | Oct 2018 – May 2020

Node.js, RabbitMQ, MongoDB

- Built **event-driven microservices on RabbitMQ** for BookMyShow's ticketing stack, decoupling booking, inventory, and notification flows for fault isolation and throughput.

Skills

Leadership: Technical leadership, product-to-architecture translation, execution planning, code review, mentoring, RCA, release readiness

Backend / AI: Node.js, TypeScript, SQL, distributed systems, microservices, REST/GraphQL, idempotency, retries, back-pressure, circuit breakers, DLQs, LLM trace/span observability, cost/latency monitoring

Frontend / Product: React, Partner Portal, internal tools, dashboards, state management, performance optimization

Data / Infra: Kafka, RabbitMQ, MongoDB, PostgreSQL, Redis, Docker, Kubernetes, GCP, AWS, CI/CD

Reliability: On-call, incident response, RCA, health probes, memory and throughput optimization

Recognition

Fynd Star: internal performance award, 4x recipient (2023–2026), for migration, reliability, and mentoring impact.

Education

B.E. Computer Science, K.S. Rangasamy College of Technology

2015 – 2019
